

SARS-CoV-2 Antigen Rapid Test Package Insen

REF L031-125A5 English

A rapid test for the qualitative detection of SARS-CoV-2 nucleocapsid antigens in nasal and

For professional in vitro diagnostic use only

nasopharyngeal swab specimens.

INTENDED USE

Rapid Test can also test specimens from asymptomatic individuals. The SARS-CoV-2 Antigen Rapid healthcare provider within the first seven days of the onset of symptoms. The SARS-CoV-2 Antigen nasopharyngeal swab specimens directly from individuals who are suspected of COVID-19 by their qualitative detection The SARS-CoV-2 Antigen Rapid Test is a lateral flow chromatographic immunoassay for the Fest does not differentiate between SARS-CoV and SARS-CoV-2. the nucleocapsid protein antigen from SARS-CoV-2 in nasal and

presence of viral antigens, but clinical correlation with patient history and other diagnostic information is with other viruses. The agent detected may not be the definite cause of disease necessary to determine infection status. Positive results do not rule out bacterial infection or co-infection detectable in upper respiratory samples during the acute phase of infection. Positive results indicate the Results are for the identification of SARS-CoV-2 nucleocapsid antigen. This antigen is generally

management decisions, including infection control decisions. Negative results should be considered consistent with COVID-19. in the context of a patient's recent exposures, history and the presence of clinical signs and symptoms rule out SARS-CoV-2 infection and should not be used as the sole basis for treatment or patient and confirmed with a molecular assay, if necessary, for patient management. Negative results do not Negative results, from patients with symptom beyond seven days, should be treated as presumptive

as an aid in the diagnosis of SARS-CoV-2 infection. individuals trained in point of care settings. SARS-CoV-2 Antigen Rapid Test is intended to be used The SARS-CoV-2 Antigen Rapid Test is intended for use by trained clinical laboratory personnel and

SUMMARY

throat, myalgia and diarrhea are found in a few cases. The main manifestations include fever, fatigue and dry cough. Nasal congestion, runny nose, sore the current epidemiological investigation, the incubation period is 1 to 14 days, mostly 3 to 7 days main source of infection; asymptomatic infected people can also be an infectious source. Based on People are generally susceptible. Currently, the patients infected by the novel coronavirus are the

The novel coronaviruses belong to the eta genus.\ COVID-19 is an acute respiratory infectious disease

PRINCIPLE

human nasal and nasopharyngeal swab specimens immunoassay for the qualitative detection of the nucleocapsid protein antigen from SARS-CoV-2 The SARS-CoV-2 Antigen Rapid Test is a qualitative membrane based chromatographic

on the presence or absence of visually colored lines. line of antibody bound on the membrane. Test results are interpreted visually at 15-30 minutes based antigen-conjugate complexes migrate across the test strip to the reaction area and are captured by a coated on the test strip. The mixture then migrates upward on the membrane by capillary action. The the specimen, will react with the anti-SARS-CoV-2 antibody-coated particles, which have been pre-When specimens are processed and added to the test cassette, SARS-CoV-2 antigens, if present in

that proper volume of specimen has been added and membrane wicking has occurred To serve as a procedure control, a colored line will always appear in the control line region indicating

PRECAUTIONS

For professional in vitro diagnostic use only. Do not use after the expiration date

- The test cassette contains anti-SARS-CoV-2 antibodies
- Do not eat, drink, or smoke in the area where the specimens or kits are handled
- Handle all specimens as if they contain infectious agents. Observe established precautions against biological hazards throughout testing and follow the standard procedures for proper disposal of specimens. Do not use the test if the pouch is damaged.
- Wear protective clothing such as laboratory coats, disposable gloves, mask and eye protection when specimens are being tested
- considered potentially infectious and be discarded according to local regulations. The used test should be discarded according to local regulations. The used test should be
- Humidity and temperature can adversely affect results
- This package insert must be read completely before performing the test. Failure to follow directions in insert may yield inaccurate test results

- The test line for a high viral load sample may become visible within 15 minutes, or as soon as the sample passes the test line region.
- The test line for a low viral load sample may become visible within 30 minutes

- STORAGE AND STABILITY
- The kit can be stored at temperatures between 2 $30\,^\circ\text{C}$. The test is stable until the expiration date printed on the sealed pouch
- The test must remain in the sealed pouch until use.
- Do not use after the expiration date DO NOT FREEZE

Materials Provided

- Disposable Swabs*

Package Insert Extraction Buffer Tubes

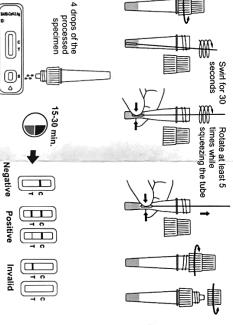

- Specimen Collection Guide
- The Disposable Swabs are produced by another manufacturer

Personal Protective Equipment Materials Required But Not Provided

- The SARS-CoV-2 Antigen Rapid Test can be performed using nasal and nasopharyngeal swab SPECIMEN COLLECTION AND PREPARATION
- after specimen collection, if stored at room temperature (15-30°C) Testing should be performed immediately after specimen collection, or at most within one (1) hour
- Please refer to the Specimen Collection Guide provided with the kit for specimen collection details

Allow the test and extraction buffer to reach room temperature (15-30 °C) prior to testing.

- Use an extraction buffer tube for each specimen to be tested and label each tube appropriately
- Unscrew the dropper cap from the extraction buffer tube without squeezing
- Insert the swab into the tube and swirl it for 30 seconds. Then rotate the swab at least 5 times
- Screw the dropper cap firmly onto the extraction buffer tube containing the while squeezing the sides of the tube. Take care to avoid splashing contents out of the tube. Remove the swab while squeezing the sides of the tube to extract the liquid from the swab. sample. Mix
- thoroughly by swirling or flicking the bottom of the tube.
- Remove the test cassette from the foil pouch and use it as soon as possible
- 876 Place the test cassette on a flat and clean surface
- Add the processed specimen to the sample well of the test cassette Unscrew the small cap from the dropper tip.
- b. Invert the extraction buffer tube with the dropper tip pointing downwards and hold it vertically.
 c. Gently squeeze the tube, dispensing 4 drops of the processed specimen into the sample well.
 Wait for the colored line(s) to appear. The result should be read at 15-30 minutes. Do not read
- 9 the result after 30 minutes. Swirl for 30 Rotate at least 5

INTERPRETATION OF RESULTS

(Please refer to the illustration above)

appears in the test line region (T). This means that no SARS-CoV-2 antigen was detected.

POSITIVE:* Two distinct colored lines appear. One line in the control line region (C) and the other NEGATIVE: Only one colored control line appears in the control region (C). No apparent colored line

antigen present in the specimen. Therefore, any shade of color in the test line region (T) should be *NOTE: The intensity of the color in the test line (T) may vary depending on the level of the SARS-CoVconsidered positive line-in the test line region (T). This means that the presence of SARS-CoV-2 antigen was detected

If the problem persists, discontinue using the test kit immediately and contact your local distributor likely reasons for control line failure. Review the procedure and repeat the test with a new test cassette INVALID: Control line fails to appear. Insufficient specimen volume or incorrect operation are the most

technique. (C) is an internal procedural control. It confirms sufficient specimen volume and correct procedura Internal procedural controls are included in the test. A colored line appearing in the control line region

Control swabs are not supplied with this kit, however, it is recommended that positive and negative test procedure performed correctly controls should be tested as a good laboratory practice to ensure that the test cassette and that the

LIMITATIONS

- the detection of SARS-CoV-2 antigens in nasal and nasopharyngeal swab specimens only. T intensity of the test line does not necessarily correlate to SARS-CoV-2 viral titer in the specimen. The SARS-CoV-2 Antigen Rapid Test is for in vitro diagnostic use only The test should be used for
- Specimens should be tested as quickly as possible after specimen collection and at most within the hour following collection.
- Use of viral transport media may result in decreased test sensitivity.
- A false-negative test may result if the level of antigen in a sample is below the detection limit of the test or if the sample was collected incorrectly
- A positive test result does not rule out co-infections with other pathogens Test results should be correlated with other clinical data available to the physician
- A negative test result is not intended to rule out other viral or bacterial infections A positive test result does not differentiate between SARS-CoV and SARS-CoV-2
- A negative result, from a patient with symptom onset beyond seven days, should be treated as presumptive and confirmed with a molecular assay, if necessary, for clinical management (If the differentiation of specific SARS viruses and strains is needed, additional testing is required.

PERFORMANCE CHARACTERISTICS

Clinical Sensitivity, Specificity and Accuracy

Nasal Swab Specimens

sensitivity and the relative specificity are as follows from individual patients who were suspected of COVID-19. The results show that the relative The performance of SARS-CoV-2 Antigen Rapid Test was established with 605 nasal swabs collected

RT-PCR (Nasophar Swab Specime Results Negative Positive 2 1 Positive 2 1 Positive 435 1 Relative Specifi	Relativ	Γ	Γ

*95% Confidence Intervals

Limit of Detection (LOD)

The LOD of SARS-CoV-2 Antigen Rapid Test was established using limiting dilutions of an inactivated viral sample. The viral sample was spiked with negative human nasal and nasopharyngeal sample pool into a series of concentrations. Each level was tested for 30 replicates. The results show that the LOD is 1.6*10² TCID₅₀/mL.

Cross-Reactivity (Analytical Specificity) and Microbial Interference

Cross-reactivity was evaluated by testing a panel of related pathogens and microorganisms that are likely to be present in the nasal cavity. Each organism and virus were tested in the absence or presence of heat-inactivated SARS-CoV-2 virus at low positive level.

No cross-reactivity or interference was observed with the following microorganisms when tested at the concentration presented in the table below. The SARS-CoV-2 Antigen Rapid Test does not differentiate between SARS-CoV and SARS-CoV-2.

PRECISION

Within-run precision was determined using 60 replicates of specimens, negative specimens and SARS-CoV-2 antigen positive specimens. The specimens were correctly identified >99% of the time. Intra-Assay

Between-run precision was determined using 60 independent assays on the same specimen: negative specimen and SARS-CoV-2 antigen positive specimen. Three different lots of the SARS-CoV-2 Antigen Rapid Test were tested using these specimens. The specimens were correctly identified >99% of the time. Inter-Assay
